"Each NFT is assigned a token identification number, and linked to its owner through the "ownerOf" function. Through the optional "ERC-721 Enumerable" extension, functionality for full ownership tracking is implemented. This differs from the ERC-20 token standard, which only tracks an owners token balance though ERC-721 also tracks it as well. Security The ERC-721 standard defines both safe and unsafe transfer functions, offering different levels of security for various implementations. These functions allow transfers initiated by the token owner, or an approved operator of their individual tokens. Further, developers can implement

custom logic to these transfer functions, providing the functionality for NFT protocols to operate."

"Someone may sell an NFT that represents their work, but the buyer will not necessarily receive copyright to that work, and the seller may not be prohibited from creating additional NFT copies of the same work. According to legal scholar Rebecca Tushnet, "In one sense, the

purchaser acquires whatever the art world thinks they have acquired. They definitely do not own the copyright to the underlying work unless it is explicitly transferred." Certain NFT projects, such as Bored Apes, explicitly assign intellectual property rights of individual images to their respective owners. The NFT collection CryptoPunks was a project that initially prohibited owners of its NFTs from using the associated digital artwork for commercial use, but later allowed such use upon acquisition by the collection's parent company. History   Early projects The first known NFT, Quantum, was created by Kevin McCoy and Anil Dash in May 2014. It consists of a video clip made by McCoy's wife, Jennifer."

"Shortly before the launch of MakerDAO, the first DAO deployed by Ethereum suffered a hacker attack. Mushegian is credited for identifying a vulnerability in most smart contracts designs; he engineered critical security features into the smart contract architecture, which prevented similar hacks in MakerDAO. In 2016, Mushegian led the team that developed Wrapped Ether (WETH), an Ethereum token compatible with the ERC-20 standard, and designed protection against another vulnerability discovered shortly before. After Mushegian's departure from MakerDAO, in 2019 he co-authored, with Fernando Martinelli, the Balancer white paper. Balancer is the first decentralized exchange capable of supporting n-dimensional price surfaces, an "automated market maker with ... key properties that cause it to function as a self-balancing weighted portfolio and price sensor"; the white paper presents the mathematical proof of those properties. In 2020, Mushegian co-founded the RAI project, a DAO which generates the Rai stablecoin, the first stablecoin to have a scalable, purely crypto-backed design."
