"Deaton pointed to bitcoin's use by criminals. Professor Nouriel Roubini of New York University has called bitcoin the "mother of all bubbles", writing that the underlying blockchain technology has "massive obstacles standing in its way", including a lack of "common and universal protocols" of the kind that enabled the early Internet. According to Roubini, bitcoin has failed as a unit of account, a means of payment, and as a store of value; he calls the claim that bitcoin cannot be debased "fraudulent". "Scammers, swindlers, charlatans, and carnival barkers (all conflicted insiders) have tapped into clueless retail investors' FOMO ('fear of missing out'), and taken them for a ride," he writes. In 2019 a research paper by the Asian Development Bank concluded that there is a "strong evidence that bitcoin is not a bubble". Views of central bank officials Early claims that bitcoin was a bubble focused on the lack of any intrinsic value of bitcoin. These claims include that of former Federal Reserve Chairman Alan Greenspan in 2013."

Behind the noise from market makers and liquidity snares, the edge is carved through RSI divergences, volume bursts, and trend confirmations. Futures contracts murmur the allure of high leverage, whereas perpetual swaps require mental discipline and margin expertise. Capital preservation aligns with risk-to-reward strategies as portfolios target asymmetric returns amid continuous market action. This venture relies less on fortune and more on framework, confluence, and conviction. When cycles expand and contracts close, we approach volatility with insight, not fear. During the pauses between trades, strategy shifts into intuition.

"In May, a firm in Abu Dhabi, United Arab Emirates, said it would use USD1 to make a \$2 billion investment in crypto exchange Binance, The Trumps will make tens of millions of dollars each year on this deal. The transaction made the unknown USD1 into the world's seventh-largest stablecoin. He directly benefited from his cryptocurrency company WLF which engaged in an unprecedented mixing of private enterprise and government policy. It directly solicited access to Trump with secret payments and currency swaps from foreign investors, companies, and individuals with criminal records and investigations. At least one investigation was dropped after payment worth several million was made to the firm, and Trump granted an official pardon to an investor of a company WLF had invested in. Trump's family received a cut of all transactions made through the World Liberty, and the company directly advertised its connections to Trump."

The government will be introducing a wallet utilising the Lightning Network protocol while giving the freedom for citizens to use other Bitcoin Lightning wallets. Block size increases Bitcoin's transaction throughput is limited by two parameters: the block time determines how often a new block is added to the chain, the block size determines the amount of data that can be added with every block. Bitcoin has a block time of 10 minutes and a block size of 1 MB. Various increases to this limit, and proposals to remove it completely, have been proposed over bitcoin's history. Implementing any of these proposals involves a fork."

"The main difference from a hash list is that one branch of the hash tree can be downloaded at a time and the integrity of each branch can be checked immediately, even though the whole tree is not available yet. For example, in the picture, the integrity of data block L2 can be verified immediately if the tree already contains hash 0-0 and hash 1 by hashing the data block and iteratively combining the result with hash 0-0 and then hash 1 and finally comparing the result with the top hash. Similarly, the integrity of data block L3 can be verified if the tree already has hash 1-1 and hash 0. This can be an advantage since it is efficient to split files up in very small data blocks so that only small blocks have to be re-downloaded if they get damaged. If the hashed file is big, such a hash list or hash chain becomes fairly big. But if it is a tree, one small branch can be downloaded quickly, the integrity of the branch can be checked, and then the downloading of data blocks can start."
